

**CLAIMS**

1. A retroreflective sheeting with triangular pyramidal frustum prism elements, which comprises a reflective element layer containing the triangular pyramidal frustum prism elements in a close-packed state formed on one surface thereof, and satisfies the following requirements:

the triangular pyramidal frustum prism element has a bottom surface with one side length thereof being in the range of 50 to 400  $\mu\text{m}$ , and a difference between a longest side and a shortest side thereof being 200  $\mu\text{m}$  or less;

the length of a longest edge of the triangular pyramidal frustum prism element is in the range of 30 to 400  $\mu\text{m}$ , and a difference between the longest edge and a shortest edge among the three edges is 100  $\mu\text{m}$  or less;

when a vertical line which intersects perpendicularly with the bottom surface is drawn from a top surface of the triangular pyramidal frustum prism element to the bottom surface thereof, the length of a longest vertical line is in the range of 20 to 250  $\mu\text{m}$ ; and

an angle between adjacent side surfaces of the triangular pyramidal frustum prism element is in the range of 85 to 95 degrees.

2. A retroreflective sheeting according to claim 1,

wherein

the lengths of the three sides of the bottom surface of the triangular pyramidal frustum prism element are different one from another.

5

3. A retroreflective sheeting according to claim 1 or claim 2, wherein

the area ratio of the top surface of the triangular pyramidal frustum prism element to the bottom surface thereof

10 is in the range of 1/100 to 1/16.

4. A retroreflective sheeting according to any one of claims 1 to 3, wherein

the reflective element layer is formed on a resin film  
15 having a thickness in the range of 30 to 300  $\mu\text{m}$ , and a total light transmittance of 20% or more.

5. A retroreflective sheeting according to any one of claims 1 to 4, wherein

20 the retroreflective sheeting has a backing film made of a resin,

the backing film is locally attached to a film having the reflective element layer formed thereon via protruding supports provided by emboss processing in such a manner that  
25 an air is sealed between the reflective element layer and the

backing film and that a plurality of airtight chambers are formed.

6. A retroreflective sheeting according to any one  
5 of claims 1 to 5, wherein

the backing film is placed adjacent on the top surfaces of the respective triangular pyramidal frustum prism elements without protruding supports.

10 7. A resin film for use in a retroreflective sheeting with triangular pyramidal frustum prism elements, which comprises a reflective element layer containing the triangular pyramidal frustum prism elements in a close-packed state formed on one surface thereof, wherein

15 the triangular pyramidal frustum prism element has a bottom surface in the shape of a triangle, with one side length thereof being in the range of 50 to 400  $\mu\text{m}$ , and a difference between a longest side and a shortest side thereof being 200  $\mu\text{m}$  or less;

20 the length of a longest edge of the triangular pyramidal frustum prism element is in the range of 30 to 400  $\mu\text{m}$ ;

when a vertical line which intersects perpendicularly with the bottom surface is drawn from a top surface of the

triangular pyramidal frustum prism element to the bottom surface thereof, the length of a longest vertical line is in the range of 20 to 250  $\mu\text{m}$ ; and

an angle between adjacent side surfaces of the  
5 triangular pyramidal frustum prism element is in the range of 85 to 95 degrees.

8. A resin film according to claim 7, wherein  
the resin film is made of one or more kinds of resins  
10 selected from the group consisting of acrylic resin,  
polycarbonate resin, polystyrene resin, polyester resin,  
polyethylene resin, polypropylene resin, polyvinylchloride  
resin, polyarylate resin, polyurethane resin, epoxy resin,  
fluororesin, and cellulose resin, and  
15 the resin film has a thickness in the range of 30 to  
300  $\mu\text{m}$ , and a total light transmittance of 20% or more, and  
is capable of forming the reflective element layer thereon.

9. A resin film according to claim 7 or 8, wherein  
20 the resin film contains a UV absorber selected from  
benzotriazols, benzophenones, triazines or the like, a light  
stabilizer selected from hindered amines or the like, an  
antioxidant including phenols, phosphates, or the like, or a  
lubricant such as montanic esters or metal stearate salts.

10. A resin film according to any one of claims 7 to 9, wherein

the resin film contains an organic dye such as 5 thioxanthenes, coumarins, perylenes, methines, benzopyrans, thioindigos, or anthraquinones, or an organic pigment such as azo pigments or phthalocyanines.
